ABSTRACT

Background: There are a lot of tuberculosis cases in East Barito district. To achieve the Minimum Service Target (SPM) for the Telang Siong Health Center UPTD Tuberculosis program in 2023, there are 9 people (45%) suffering from pulmonary TB who receive services according to standards and are actively undergoing treatment. Meanwhile, there were only 36 suspected pulmonary TB sufferers who were examined for sputum (28.8%).

Objective: To identify nursing care for patients who has suffering pulmonary tuberculosis and ineffective airway nursing problems at the Telang Siong UPTD Health Center, Paju Epat District.

Results: The effective cough excercise by providing a semi-fowler-fowler position, deep breathing and applying the Evidence Based Practice "Active Cycle of Breathing" the problem of ineffective airway in pulmonary tuberculosis sufferers has been solved.

Conclusion: After carrying out effective coughing exercises for 1 x 20 minutes, the problem of clearing the client's airway could be solved with effective coughing excercise, by achieving the criteria for increased effective cough, decreased excess sputum and decreased the crackles.

Key Word: Tuberculosis, Pulmonary Tuberculosis, airway, Active Cycle Of Breathing
