ABSTRACT

Background: Pulmonary tuberculosis is caused by the bacteria *Mycobacterium Tuberculosis* (*M. Tuberculosis*) and is an infectious disease. The main symptoms are coughing for 2 weeks or more, coughing up phlegm, sputum mixed with blood, shortness of breath, weakness, decreased appetite, decreased weight, night sweats. In 2019 in Barito Timur, the number of suspected Tuberculosis cases who received standardised services was 914, the number of all Tuberculosis cases was 159, there were no cases of Tuberculosis in children and the Case Notification Rate (CNR) of all Tuberculosis cases was 125 per 100,000 population.

Objective: Apply nursing care to patients with Pulmonary Tuberculosis and ineffective airway clearance nursing problems in the kenanga room of Tammiang Layang Hospital.

Results: The results obtained with the application of evidence-based practice in Mr S with chest physiotherapy and effective coughing can overcome the problem of ineffective airway clearance in pulmonary tuberculosis patients.

Conclusion: After applying chest physiotherapy measures and effective coughing, the problem of airway clearance in clients can be resolved marked by the achievement of the criteria for effective cough results to increase, ronchi decreased, excess sputum decreased.

Keywords: Pulmonary tuberculosis, ineffective airway clearance
